Experiment:11

AIM

To execute and analyze Nmap timing and performance commands in Kali Linux using **Aggressive Speed Scan (-T4)** and **Insane Speed Scan (-T5)**.

ALGORITHM

1. Open the **Kali Linux Terminal**.
2. Create a text file using the command touch exp11.txt.
3. Verify the file using the ls command.
4. Execute the **Aggressive Speed Scan** using:

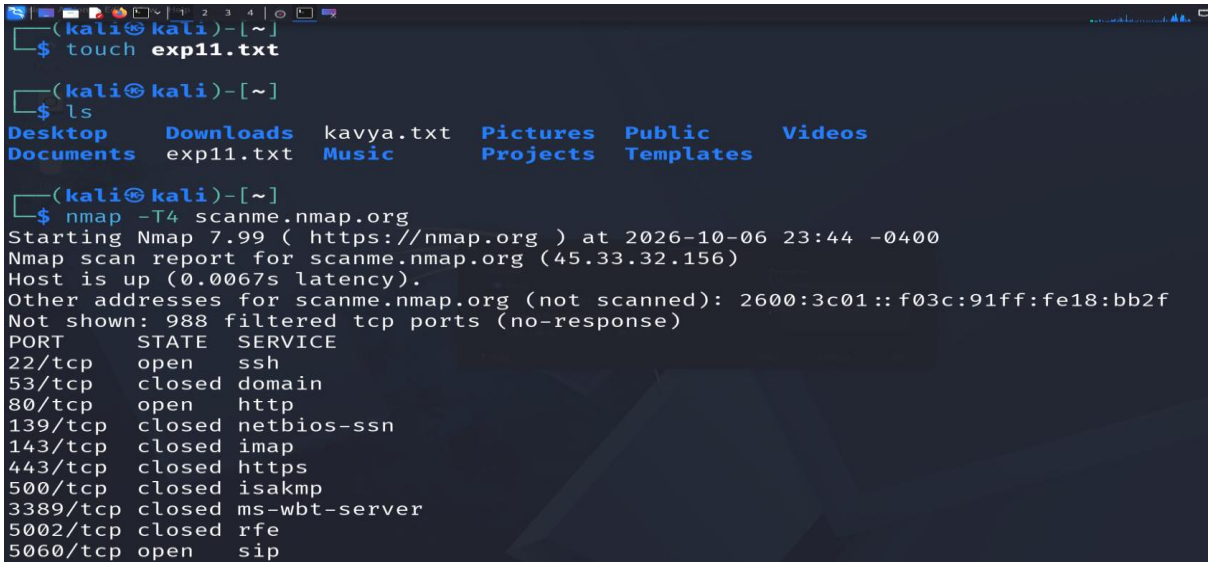

nmap -T4 scanme.nmap.org

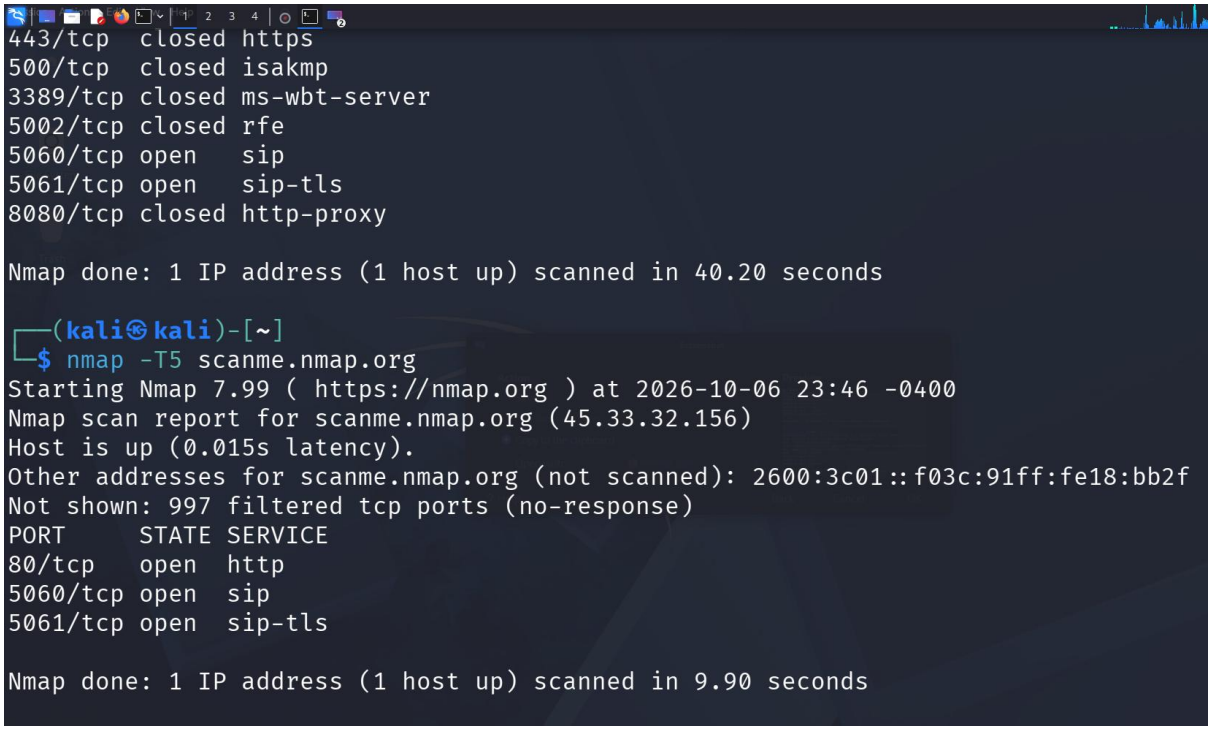

5. Observe and record the scan results, including the host status and open/closed ports.
6. Execute the **Insane Speed Scan** using:

nmap -T5 scanme.nmap.org

7. Observe the scan results and compare the scanning speed with the aggressive scan.
8. Record the obtained results.

OUTPUT:

RESULT

The Nmap timing and performance scans were successfully executed in Kali Linux. The **Aggressive Speed Scan (-T4)** detected the target host and displayed its port and service information. The **Insane Speed Scan (-T5)** was also successfully executed with a higher scanning speed. Thus, the different Nmap timing options were successfully demonstrated.
